## **Installation Instructions for Landscape Turf**

### **Prepare the Base**

Most outdoor applications require preparation of an aggregate base to allow proper water drainage. Simply clear the surface where your Landscape Turf will be placed, removing any unwanted grass and roots. Once clear, add a two to four-inch layer of crushed aggregate until achieving the desired shape and contour. Work the aggregate with a rake and hand tamp until the surface is compact and smooth.

### **Trim to Size**

With the base ready, position your Landscape Turf and trim to shape. If using more than one roll of Landscape Turf, make sure the "grain" of the grass fibers point in the same direction.

### **Glue Together Seams**

To seam your Turf together, align two pieces of the Turf edge-to-edge. Fold back the edges to lay the Turf seaming cloth the length of the seam.

### **Secure in Place**

Secure the seaming cloth in place. Apply seaming adhesive to the cloth, spreading to a consistent thickness. After a few minutes, slowly ease the two edges back together, checking the fit as you go. To secure your Turf, use five to six-inch galvanized nails or landscape anchor pins around the perimeter and where necessary to keep your Turf flat.

### **Groom Your Grass**

Finally, Use a landscape rake or broom to brush the fibers up and rinse with a garden hose. Periodic brushing and rinsing will keep your Turf looking fresh, natural and beautiful for years to come.
